If the governor balls fly out, the brush is moved along B, K, so that there is contact with it during a greater part of the revolution than before; and if the governor balls come together, the speed of the motor being too small, the brush is moved in the opposite direction so that it makes contact with B for a longer time during each revolution. If the motors are in series, we arrange that the periodic governor shunts the current periodically, instead of introducing resistance. In this case the connections are as follows: B is made of wood, while K is made Fig. 65. PERIODIC GOVERNOR. of metal. K is connected to one end of a shunt coil, the other end of the shunt being connected to one of the terminals of the motor and A is connected to the other terminal of the motor. If, then, A rests on B, the shunt is inoperative and all the current passes through the motor; whereas, if it rests on K, the shunt is in operation, and part of the current only passes through the motor. It will be seen that both these governors invented by Professors Ayrton and Perry, have partially, at least, the fault of depending on artificial resistances whether they be used for parallel or series work. The loss of energy thus occasioned can be reduced by making the resistance high for parallel, and...
