

Flame Speeds of Methane-Air, Propane-Air, and Ethylene-Air Mixtures at Low Initial Temperatures

Filesize: 9.45 MB

Reviews

It is simple in study safer to understand. It can be full of knowledge and wisdom Your way of life span is going to be enhance when you full looking at this book.

BiblioGov. Paperback. Book Condition: New. This item is printed on demand. Paperback. 30 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. Flame speeds were determined for methane-air, propane-air, and ethylene-air mixtures at -73 C and for methane-air mixtures at -132 C. The data extend the curves of maximum flame speed against initial mixture temperature previously established for the range from room temperature to 344 C. Empirical equations for maximum flame speed u (cm/sec) as a function of initial mixture temperature T (sub O) were determined to be as follows: for methane, for T (sub O) from 141 to 615 K, $u = 80.000160 T^{(sub O)}(\exp 2.11)$; for propane, for T (sub O) from 200 to 616 K, $u = 100.000342 T^{(sub O)}(\exp 2.00)$; for ethylene, for T (sub O) from 200 to 617 K, $u = 100.00259 T^{(sub O)}(\exp 1.74)$. Relative flame speeds at low initial temperatures were predicted within approximately 20 percent by either the thermal theory as presented by Semenov or by the diffusion theory of Tanford and Pease. The same order was found previously for high initial temperatures. The low-temperature data were also found to extend the linear correlations between maximum flame speed and calculated equilibrium active-radical concentrations, which were established by the previously reported high-temperature data. This item ships from La Vergne, TN. Paperback.
